

GLOBAL USED MACHINERY INSPECTIONS

The used machinery business has become globalised. Suitable machines and equipment for construction tasks are not always found at home. Buyers search on international platforms and often find what they are looking for. When buying second-hand machines, one can hope to get a good deal. But it would be probably far better receiving correct information from professional sources.

German service provider, MEVAS, has been offering independent inspection services for heavy equipment, cranes, trucks, and special civil engineering machinery since 2006. Experienced inspectors put the equipment through its paces. What started as a one-man business in Germany is now the

globally most important provider of this specialised service. Local inspectors are available in more than 25 countries. Further countries can be reached easily by short travel distance.

A MEVAS inspector is usually not too far from the machine or crane on offer. Most of the time, an inspection costs less than it would cost to replace a defective tire or replace a leaking hydraulic cylinder. After one maximum working day of inspecting, the customer will receive a report, a summary of the condition and pictures. Inspection results are provided via the Cloud for easy access and sharing.

Why has the service grown steadily since 2006? Customers trust in the professionalism of the company. Customers can be sure that an inspector does not deal with machines. All information about the inspected machines is kept confidential and exclusively shared with the customer.

To ensure the quality of the service, the Founder, Wolfgang Bühn still goes out into the field to train inspectors. The technicians receive training and regular updates on the state of the art. The team in the office guarantees a smooth process and good communication between buyer, seller and inspector.

In addition to the technical analysis, a valuation can be made. MEVAS is also available for the evaluation of fleets. No matter the location. ■
